

▼ This medicinal product is subject to additional monitoring in Australia. This will allow quick identification of new safety information. Healthcare professionals are asked to report any suspected adverse events at [www.tga.gov.au/reporting-problems](http://www.tga.gov.au/reporting-problems).

## **AUSTRALIAN PRODUCT INFORMATION**

### **CABOMETRYX (CABOZANTINIB) TABLETS 20, 40 AND 60MG**

#### **1 NAME OF THE MEDICINE**

Cabozantinib (S)-malate

#### **2 QUALITATIVE AND QUANTITATIVE COMPOSITION**

CABOMETRYX tablets contain cabozantinib(S)-malate equivalent to either 20 mg, 40 mg or 60 mg of cabozantinib as the active ingredient.

Cabozantinib (S)-malate is a white to off-white, non-hygroscopic, crystalline substance. It is practically insoluble above pH of 4 and in water.

For the full list of excipients, see section 6.1 LIST OF EXCIPIENTS.

#### **3 PHARMACEUTICAL FORM**

CABOMETRYX 20 mg film-coated tablets are yellow, round with no score, and debossed with “XL” on one side and “20” on the other side of the tablet.

CABOMETRYX 40 mg film-coated tablets are yellow triangle shaped with no score, and debossed with “XL” on one side and “40” on the other side of the tablet.

CABOMETRYX 60 mg film-coated tablets are yellow oval shaped with no score, and debossed with “XL” on one side and “60” on the other side of the tablet.

#### **4 CLINICAL PARTICULARS**

##### **4.1 THERAPEUTIC INDICATIONS**

Cabometryx™ is indicated for the treatment of advanced renal cell carcinoma (RCC) in adults following prior treatment with vascular endothelial growth factor targeted therapy.

##### **4.2 DOSE AND METHOD OF ADMINISTRATION**

Therapy with CABOMETRYX should be initiated by a physician experienced in the administration of anticancer medicinal products.

The recommended dose of CABOMETRYX is 60 mg once daily. Treatment should continue until the patient is no longer clinically benefiting from therapy or until unacceptable toxicity occurs.

Management of suspected adverse drug reactions may require temporary interruption and/or dose reduction of CABOMETRYX therapy (see Table 1 and Section 4.4 SPECIAL

WARNINGS AND PRECAUTIONS FOR USE). When dose reduction is necessary, it is recommended to reduce to 40 mg daily, and then to 20 mg daily. Dose interruptions are recommended for management of CTCAE grade 3 or greater toxicities or intolerable grade 2 toxicities. Dose reductions are recommended for events that, if persistent, could become serious or intolerable.

If a patient misses a dose, the missed dose should not be taken if it is less than 12 hours before the next dose.

**Table 1: Recommended CABOMETYX dose modifications for adverse reactions**

<b>Adverse reaction and severity</b>	<b>Treatment Modification</b>
Grade 1 and Grade 2 adverse reactions which are tolerable and easily managed	Dose adjustment is usually not required. Consider adding supportive care as indicated.
Grade 2 adverse reactions which are intolerable and cannot be managed with a dose reduction or supportive care	Interrupt treatment until the adverse reaction resolves to Grade $\leq 1$ . Add supportive care as indicated. Consider re-initiating at a reduced dose.
Grade 3 adverse reactions (except clinically nonrelevant laboratory abnormalities)	Interrupt treatment until the adverse reaction resolves to Grade $\leq 1$ . Add supportive care as indicated. Re-initiate at a reduced dose.
Grade 4 adverse reactions (except clinically nonrelevant laboratory abnormalities)	Interrupt treatment. Institute appropriate medical care. If adverse reaction resolves to Grade $\leq 1$ , re-initiate at a reduced dose. If adverse reaction does not resolve, permanently discontinue CABOMETYX.

Note: Toxicity grades are in accordance with National Cancer Institute Common Terminology Criteria for Adverse Events Version 4.0 (NCI-CTCAE v4)

## **Special populations**

### Elderly patients

No specific dose adjustment for the use of cabozantinib in older people ( $\geq 65$  years) is recommended.

### Race

There is little experience with cabozantinib in non-White patients.

#### Patients with renal impairment

Cabozantinib should be used with caution in patients with mild or moderate renal impairment. Cabozantinib is not recommended for use in patients with severe renal impairment as safety and efficacy have not been established in this population.

#### Patients with hepatic impairment

In patients with mild or moderate hepatic impairment the recommended dose is 40 mg once daily. Patients should be monitored for adverse events and dose adjustment or treatment interruption should be considered as needed. Cabozantinib is not recommended for use in patients with severe hepatic impairment as safety and efficacy have not been established in this population.

#### Patients with cardiac impairment

There is limited data in patients with cardiac impairment. No specific dosing recommendations can be made.

#### Paediatric population

The safety and efficacy of cabozantinib in children and adolescents aged <18 years have not yet been established. No data are available.

#### Method of administration

CABOMETYX is for oral use. The tablets should be swallowed whole and not crushed. Patients should be instructed to not eat anything for at least 2 hours before through 1 hour after taking CABOMETYX.

### **4.3 CONTRAINDICATIONS**

Hypersensitivity to the active substance or to any of the excipients (see Section 6.1 LIST OF EXCIPIENTS ).

### **4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE**

As most events that require dose modification or interruption can occur early in the course of treatment, the physician should evaluate the patient closely during the first eight weeks of treatment to determine if this is necessary. Events that generally have early onset include hypocalcaemia, hypokalaemia, thrombocytopenia, hypertension, palmar-plantar erythrodysesthesia syndrome (PPES), proteinuria, and gastrointestinal (GI) events (abdominal pain, mucosal inflammation, constipation, diarrhoea, vomiting).

Dose reductions and dose interruptions due to an adverse event occurred in 59.8% and 70%, respectively, of cabozantinib-treated patients in the pivotal clinical trial. The median daily dose of cabozantinib was 45.3 mg. Two dose reductions were required in 19.3% of patients. The median time to first dose reduction was 55 days, and to first dose interruption was 38 days.

Safety and efficacy of cabozantinib has not been evaluated in patients with NMYHA Class 3 or 4 Heart Failure and patients with endobronchial manifestations of RCC.

### **Perforations and fistulas**

Serious gastrointestinal (GI) perforations and fistulas, sometimes fatal, have been observed with cabozantinib. Patients who have inflammatory bowel disease (e.g., Crohn's disease, ulcerative colitis, peritonitis, diverticulitis, or appendicitis), have tumour infiltration in the GI tract, or have complications from prior GI surgery (particularly when associated with delayed or incomplete healing) should be carefully evaluated before initiating cabozantinib therapy and subsequently they should be monitored closely for symptoms of perforations and fistulas including abscesses. Persistent or recurring diarrhoea while on treatment may be a risk factor for the development of anal fistula. Cabozantinib should be discontinued in patients who experience a GI perforation or a fistula that cannot be adequately managed.

### **Thromboembolic events**

Events of venous thromboembolism, including pulmonary embolism, and events of arterial thromboembolism have been observed with cabozantinib. Cabozantinib should be used with caution in patients who are at risk for, or who have a history of, these events. Cabozantinib should be discontinued in patients who develop an acute myocardial infarction or any other clinically significant arterial thromboembolic complication.

### **Haemorrhage**

Severe haemorrhage has been observed with cabozantinib. Patients who have a history of severe bleeding prior to treatment initiation should be carefully evaluated before initiating cabozantinib therapy. Cabozantinib should not be administered to patients that have or are at risk for severe haemorrhage.

### **Wound complications**

Wound complications have been observed with cabozantinib. Cabozantinib treatment should be stopped at least 28 days prior to scheduled surgery, including dental surgery, if possible. The decision to resume cabozantinib therapy after surgery should be based on clinical judgment of adequate wound healing. Cabozantinib should be discontinued in patients with wound healing complications requiring medical intervention.

### **Hypertension**

Hypertension has been observed with cabozantinib. Blood pressure should be well-controlled prior to initiating cabozantinib. During treatment with cabozantinib, all patients should be monitored for hypertension and treated as needed with standard anti-hypertensive therapy. In the case of persistent hypertension despite use of anti-hypertensives, the cabozantinib dose should be reduced. Cabozantinib should be discontinued if hypertension is severe and persistent despite anti-hypertensive therapy and dose reduction of cabozantinib. In case of hypertensive crisis, cabozantinib should be discontinued.

### **Diarrhoea**

Diarrhoea has been observed with cabozantinib, and can be severe. If diarrhoea cannot be managed with standard antidiarrhoeal treatment, interruption of treatment with cabozantinib

should be considered. Cabozantinib should be restarted with a lower dose when diarrhoea has been resolved to grade 1.

### **Palmar-plantar erythrodysesthesia syndrome**

Palmar-plantar erythrodysesthesia syndrome (PPES) has been observed with cabozantinib. When PPES is severe, interruption of treatment with cabozantinib should be considered. Cabozantinib should be restarted with a lower dose when PPES has been resolved to grade 1.

### **Proteinuria**

Proteinuria has been observed with cabozantinib. Urine protein should be monitored regularly during cabozantinib treatment. Cabozantinib should be discontinued in patients who develop nephrotic syndrome.

### **Reversible posterior leukoencephalopathy syndrome**

Reversible Posterior Leukoencephalopathy Syndrome (RPLS), also known as Posterior Reversible Encephalopathy Syndrome (PRES), has been observed with cabozantinib. This syndrome should be considered in any patient presenting with multiple symptoms, including seizures, headache, visual disturbances, confusion or altered mental function. Cabozantinib treatment should be discontinued in patients with RPLS.

### **Prolongation of QT interval**

Cabozantinib should be used with caution in patients with a history of QT interval prolongation, patients who are taking antiarrhythmics, or patients with relevant pre-existing cardiac disease, bradycardia, or electrolyte disturbances. When using cabozantinib, periodic monitoring with on-treatment ECGs and electrolytes (serum calcium, potassium, and magnesium) should be considered.

### **Hepatic Function**

Liver function should be monitored in patients with known intra-hepatic metastasis as clinically indicated.

### **CYP3A4 inducers and inhibitors**

Cabozantinib is a CYP3A4 substrate. Concurrent administration of cabozantinib with the strong CYP3A4 inhibitor ketoconazole resulted in an increase in cabozantinib plasma exposure. Caution is required when administering cabozantinib with agents that are strong CYP3A4 inhibitors. Concurrent administration of cabozantinib with the strong CYP3A4 inducer rifampicin resulted in a decrease in cabozantinib plasma exposure. Therefore, chronic administration of agents that are strong CYP3A4 inducers with cabozantinib should be avoided (see Section 4.2 DOSE and METHOD of ADMINISTRATION and Section 4.5 INTERACTIONS WITH OTHER MEDICINES and OTHER FORMS OF INTERACTIONS).

### **P-glycoprotein substrates**

Cabozantinib was an inhibitor ( $IC_{50} = 7.0 \mu M$ ), but not a substrate, of P-glycoprotein (P-gp) transport activities *in vitro*. Therefore, cabozantinib may have the potential to increase plasma concentrations of co-administered substrates of P-gp. Subjects should be cautioned regarding

taking a P-gp substrate (e.g., fexofenadine, ambrisentan, dabigatran etexilate, digoxin, colchicine, maraviroc, posaconazole, ranolazine, saxagliptin, sitagliptin, talinolol, tolvaptan) while receiving cabozantinib (see Section 4.5 INTERACTIONS WITH OTHER MEDICINES and OTHER FORMS OF INTERACTIONS).

### **MRP2 inhibitors**

Administration of MRP2 inhibitors may result in increases in cabozantinib plasma concentrations. Therefore, concomitant use of MRP2 inhibitors (e.g. cyclosporine, efavirenz, emtricitabine) should be approached with caution (see Section 4.5 INTERACTIONS WITH OTHER MEDICINES and OTHER FORMS OF INTERACTIONS).

### **Excipient related warnings**

Patients with rare hereditary problems of galactose intolerance, the Lapp lactase deficiency or glucose galactose malabsorption should not take this medicine.

### **Use in the elderly**

No specific dose adjustment for the use of cabozantinib in older people ( $\geq 65$  years) is recommended.

### **Paediatric use**

The safety and efficacy of cabozantinib in children and adolescents aged  $<18$  years have not yet been established. No data are available.

In juvenile rat studies, target organs for toxicity were generally similar to those seen in adult animals. Tooth abnormalities and whitening as well as effects on bones including reduced bone mineral content and density, physal hypertrophy, and decreased cortical bone also occurred at all dose levels. Adverse effects on the developing reproductive systems were also noted. The findings in juvenile rats indicate a potential risk for children and adolescents.

### **Effects on laboratory tests**

No data available

## **4.5 INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTIONS**

### **Effect of other medicinal products on cabozantinib**

#### *CYP3A4 inhibitors and inducers*

Administration of the strong CYP3A4 inhibitor ketoconazole (400 mg daily for 27 days) to healthy volunteers decreased cabozantinib clearance (by 29%) and increased single-dose plasma cabozantinib exposure (AUC) by 38%. Therefore, co-administration of strong CYP3A4 inhibitors (e.g., ritonavir, itraconazole, erythromycin, clarithromycin, grapefruit juice) with cabozantinib should be approached with caution.

Administration of the strong CYP3A4 inducer rifampicin (600 mg daily for 31 days) to healthy volunteers increased cabozantinib clearance (4.3-fold) and decreased single-dose

plasma cabozantinib exposure (AUC) by 77%. Chronic co-administration of strong CYP3A4 inducers (e.g., phenytoin, carbamazepine, rifampicin, phenobarbital or herbal preparations containing St. John's Wort [*Hypericum perforatum*]) with cabozantinib should therefore be avoided.

#### Gastric pH modifying agents

Co-administration of proton pump inhibitor (PPI) esomeprazole (40 mg daily for 6 days) with a single dose of 100 mg cabozantinib to healthy volunteers resulted in no clinically-significant effect on plasma cabozantinib exposure (AUC). No dose adjustment is indicated when gastric pH modifying agents (i.e., PPIs, H<sub>2</sub> receptor antagonists, and antacids) are co-administered with cabozantinib.

#### MRP2 inhibitors

In vitro data demonstrate that cabozantinib is a substrate of MRP2. Therefore, administration of MRP2 inhibitors may result in increases in cabozantinib plasma concentrations.

#### Bile salt-sequestering agents

Bile salt-sequestering agents such as cholestyramine and cholestigel may interact with cabozantinib and may impact absorption (or reabsorption) resulting in potentially decreased exposure (see Section 5.2 PHARMACOKINETIC PROPERTIES). The clinical significance of these potential interactions is unknown.

#### **Effect of cabozantinib on other medicinal products**

The effect of cabozantinib on the pharmacokinetics of contraceptive steroids has not been investigated. As unchanged contraceptive effect may not be guaranteed, an additional contraceptive method, such as a barrier method, is recommended.

Because of high plasma protein binding levels of cabozantinib (see Section 5.2 PHARMACOKINETIC PROPERTIES) a plasma protein displacement interaction with warfarin may be possible. In case of such combination, INR values should be monitored.

#### P-glycoprotein substrates

Cabozantinib was an inhibitor (IC<sub>50</sub> = 7.0 μM), but not a substrate, of P-gp transport activities *in vitro*. Therefore, cabozantinib may have the potential to increase plasma concentrations of co-administered substrates of P-gp. Subjects should be cautioned regarding taking a P-gp substrate (e.g., fexofenadine, ambrisentan, dabigatran etexilate, digoxin, colchicine, maraviroc, posaconazole, saxagliptin, sitagliptin, tolvaptan) while receiving cabozantinib.

### **4.6 FERTILITY, PREGNANCY AND LACTATION**

#### **Effects on fertility**

Fertility studies in rats have shown reduced male and female fertility at exposure levels (AUC) similar to human clinical exposure. Further, hypospermatogenesis was observed in male dogs at exposure levels below human clinical exposure levels at intended therapeutic dose.

There are no data on human fertility. Based on non-clinical safety findings, male and female fertility may be compromised by treatment with cabozantinib. Both men and women should be advised to seek advice and consider fertility preservation before treatment.

#### **Use in pregnancy (Category D)**

There are no studies in pregnant women using cabozantinib. Studies in animals have shown embryofetal lethality and teratogenic effects. The potential risk for humans is unknown. Cabozantinib should not be used during pregnancy unless the clinical condition of the woman requires treatment with cabozantinib.

Women of childbearing potential must be advised to avoid pregnancy while on cabozantinib. Female partners of male patients taking cabozantinib must also avoid pregnancy. Effective methods of contraception should be used by male and female patients and their partners during therapy, and for at least 4 months after completing therapy. Because oral contraceptives might possibly not be considered as “effective methods of contraception”, they should be used together with another method, such as a barrier method (see Section 4.5 - INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTIONS).

Cabozantinib crossed the placenta in rats and rabbits. In embryofetal development studies in pregnant rats, daily oral administration of cabozantinib throughout organogenesis caused increased embryofetal lethality at  $\geq 0.03$  mg/kg/day. Foetal findings included delayed ossification and skeletal variations at  $\geq 0.01$  mg/kg/day and foetal oedema, cleft palate/lip, dermal aplasia and kinked or rudimentary tail at 0.6 mg/kg/day.

In pregnant rabbits, daily oral administration of cabozantinib throughout organogenesis resulted in findings of visceral malformations and variations including reduced spleen size and missing lung lobe at 3 mg/kg/day. Exposures (AUC) at doses causing adverse embryofetal effects in rats and rabbits were well below the human AUC at the recommended dose.

#### **Use in lactation.**

It is not known whether cabozantinib and/or its metabolites are excreted in human milk. Cabozantinib appeared to be excreted in the milk of rats as significant levels of cabozantinib were detected in the plasma of breast-fed pups. Because of the potential harm to the infant, mothers should discontinue breast-feeding during treatment with cabozantinib, and for at least 4 months after completing therapy.

#### **4.7 EFFECTS ON ABILITY TO DRIVE AND USE MACHINES**

Cabozantinib has minor influence on the ability to drive and use machines. Adverse reactions such as fatigue and weakness have been associated with cabozantinib. Therefore, caution should be recommended when driving or operating machines.

#### 4.8 ADVERSE EFFECTS (UNDESIRABLE EFFECTS)

Reporting suspected adverse reactions after registration of the medicinal product is important. It allows continued monitoring of the benefit-risk balance of the medicinal product.

Healthcare professionals are asked to report any suspected adverse reactions at [www.tga.gov.au/reporting-problems](http://www.tga.gov.au/reporting-problems).

##### Summary of safety profile

The most common serious adverse reactions associated with cabozantinib are diarrhoea (1.8%), pulmonary embolism (1.5%), fatigue (1.2%) and hypomagnesaemia (1.2%). The most frequent adverse reactions of any grade (experienced by at least 25% of patients) included diarrhoea (74%), fatigue (56%), nausea (50%), decreased appetite (46%), palmar-plantar erythrodysesthesia syndrome (PPES) (42%), hypertension (37%), vomiting (32%), weight decreased (31%), and constipation (25%).

##### Tabulated list of adverse reactions

Adverse reactions are listed in Table 2 according to MedDRA system organ class and frequency categories. Frequencies are based on all grades and defined as: very common ( $\geq 1/10$ ), common ( $\geq 1/100$  to  $< 1/10$ ); uncommon ( $\geq 1/1,000$  to  $< 1/100$ ). Within each frequency grouping, adverse reactions are presented in order of decreasing seriousness.

**Table 2: Adverse reactions reported with cabozantinib**

MedDRA System Organ Class	Very Common	Common	Uncommon
Infections and infestations		abscess	
Blood and lymphatic disorders	anaemia		
Endocrine disorders	hypothyroidism		
Metabolism and nutrition disorders	decreased appetite, hypophosphataemia, hypoalbuminaemia, hypomagnesaemia, hyponatraemia, hypokalaemia, hyperkalaemia, hypocalcaemia, hyperbilirubinemia	dehydration	
Nervous system disorders	dysgeusia, headache, dizziness		convulsion
Ear and labyrinth disorders		tinnitus	
Vascular disorders	hypertension	Pulmonary embolism	

<b>MedDRA System Organ Class</b>	<b>Very Common</b>	<b>Common</b>	<b>Uncommon</b>
Respiratory, thoracic, and mediastinal disorders	Dysphonia, dyspnoea, cough		
Gastrointestinal disorders	diarrhoea, nausea, vomiting, stomatitis, constipation, abdominal pain, dyspepsia	abdominal pain upper, gastroesophageal reflux disease, haemorrhoids	anal fistula, pancreatitis
Hepatobiliary disorders			Hepatitis cholestatic
Skin and subcutaneous tissue disorders	palmar-plantar erythrodysesthesia syndrome, rash, dry skin	Pruritis, alopecia	
Musculoskeletal and connective tissue disorders	pain in extremity, muscle spasms, arthralgia		Osteonecrosis of the jaw
Renal and urinary disorders	proteinuria		
General disorders and administration site conditions fatigue	fatigue, mucosal inflammation, asthenia	Peripheral oedema	
Investigations	weight decreased, serum ALT, AST, and ALP increased, creatinine increased, triglycerides increased, hyperglycaemia, hypoglycaemia, lymphopenia, neutropenia, thrombocytopenia, GGT increased, amylase increased, blood cholesterol increased, lipase increased		

Adverse events that were reported in at least 10% of patients in the randomised, open-label trial in which 331 patients with advanced renal cell carcinoma received 60 mg CABOMETYX and 322 patients received 10 mg everolimus administered daily until disease

progression or unacceptable toxicity, are included in Table 3. The median duration of treatment was 7.6 months (range 0.3 – 20.5) for patients receiving CABOMETYX and 4.4 months (range 0.21 – 18.9) for patients receiving everolimus.

**Table 3: Adverse Reactions Occurring in ≥ 10% Patients Who Received CABOMETYX**

<sup>1</sup> One subject randomised to everolimus received cabozantinib.

<sup>2</sup> National Cancer Institute Common Terminology Criteria for Adverse Events Version 4.0

<sup>3</sup> Includes PT terms abdominal pain, abdominal pain upper, and abdominal pain lower

<sup>4</sup> Includes PT terms rash, rash erythematous, rash follicular, rash macular, rash papular, rash pustular, rash vesicular, genital rash, intermittent leg rash, rash on scrotum and penis, rash maculo-papular, rash pruritic, contact dermatitis, dermatitis acneiform

<sup>5</sup> Includes PT terms hypertension, blood pressure increased, hypertensive crisis, blood pressure

### Description of selected adverse reactions

Data for the following reactions are based on patients who received CABOMETYX 60 mg once daily in the pivotal RCC study (see Section 5.1 PHARMACODYNAMIC PROPERTIES – CLINICAL TRIALS).

#### *Gastrointestinal (GI) perforation*

GI perforations were reported in 0.9% of cabozantinib-treated RCC patients (3/331). Events were Grade 2 or 3. Median time to onset was 10.0 weeks. Fatal perforations have occurred in the cabozantinib clinical program.

#### *Fistulas*

Fistulas were reported in 1.2% (4/331) of cabozantinib-treated patients, and included anal fistulas in 0.6% (2/331) cabozantinib-treated patients. One event was Grade 3; the remainder was Grade 2. Median time to onset was 30.3 weeks.

#### *Haemorrhage*

The incidence of severe haemorrhagic events (Grade  $\geq$  3) was 2.1% in cabozantinib-treated RCC patients (7/331). Median time to onset was 20.9 weeks. Fatal haemorrhages have occurred in the cabozantinib clinical program.

#### *Reversible Posterior Leukoencephalopathy Syndrome (RPLS)*

No case of RPLS was reported in this study, but RPLS has been reported in other clinical studies.

## 4.9 OVERDOSE

For information on the management of overdose, contact the Poisons Information Centre on 13 11 26 (Australia).

There is no specific treatment for cabozantinib overdose and possible symptoms of overdose have not been established.

In the event of suspected overdose, cabozantinib should be withheld and supportive care instituted. Metabolic clinical laboratory parameters should be monitored at least weekly or as deemed clinically appropriate to assess any possible changing trends. Adverse reactions associated with overdose are to be treated symptomatically.

## **5 PHARMACOLOGICAL PROPERTIES**

### **5.1 PHARMACODYNAMIC PROPERTIES**

Pharmacotherapeutic group: antineoplastic agent, protein kinase inhibitor.

#### **Mechanism of action**

Cabozantinib is a small molecule that inhibits multiple receptor tyrosine kinases (RTKs) implicated in tumour growth and angiogenesis, pathologic bone remodelling, drug resistance, and metastatic progression of cancer. Cabozantinib was evaluated for its inhibitory activity against a variety of kinases and was identified as an inhibitor of MET (hepatocyte growth factor receptor protein) and VEGF (vascular endothelial growth factor) receptors. In addition, cabozantinib inhibits other tyrosine kinases including the GAS6 receptor (AXL), RET, ROS1, TYRO3, MER, the stem cell factor receptor (KIT), TRKB, Fms-like tyrosine kinase-3 (FLT3), and TIE-2.

#### Pharmacodynamic effects

Cabozantinib exhibited dose-related tumour growth inhibition, tumour regression, and/or inhibited metastasis in a broad range of preclinical tumour models.

#### Cardiac electrophysiology

An increase from baseline in corrected QT interval by Fridericia (QTcF) of 10 – 15 ms on Day 29 (but not on Day 1) following initiation of cabozantinib treatment (at a dose of 140 mg once daily) was observed in a controlled clinical study in medullary thyroid cancer patients. This effect was not associated with a change in cardiac wave form morphology or new rhythms. No cabozantinib-treated subjects in this study had a confirmed QTcF >500 ms, nor did any cabozantinib-treated subjects in the RCC study (at a dose of 60 mg).

#### **Clinical trials**

##### **Renal Cell Carcinoma**

The safety and efficacy of CABOMETYX were evaluated in a randomised, open-label, multicentre Phase 3 study. Patients (N=658) with advanced RCC with a clear cell component who had previously received at least 1 prior VEGF receptor tyrosine kinase inhibitor (VEGFR TKI) were randomised (1:1) to receive CABOMETYX (N=330) or everolimus (N=328). Patients could have received other prior therapies, including cytokines, and antibodies targeting VEGF, the programmed death 1 (PD-1) receptor, or its ligands. Patients

with treated brain metastases were allowed. Progression-free survival (PFS) was assessed by a blinded independent radiology review committee, and the primary analysis was conducted among the first 375 subjects randomised. Secondary efficacy endpoints were objective response rate (ORR) and overall survival (OS). Tumour assessments were conducted every 8 weeks for the first 12 months, then every 12 weeks thereafter.

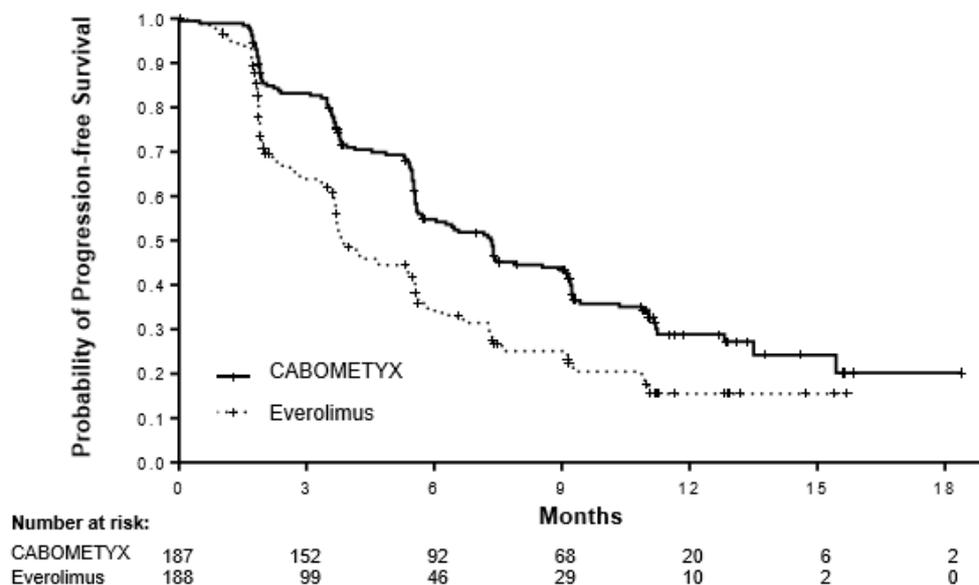

The baseline demographic and disease characteristics were similar between the CABOMETYX and everolimus arms. The majority of the patients were male (75%), with a median age of 62 years. Seventy-one percent (71%) received only one prior VEGFR TKI; 41% of patients received sunitinib as their only prior VEGFR TKI. According to the Memorial Sloan Kettering Cancer Centre criteria for prognostic risk category, 46% were favourable (0 risk factors), 42% were intermediate (1 risk factor), and 13% were poor (2 or 3 risk factors). Fifty-four percent (54%) of patients had 3 or more organs with metastatic disease, including lung (63%), lymph nodes (62%), liver (29%), and bone (22%). The median duration of treatment was 7.6 months (range 0.3 – 20.5) for patients receiving CABOMETYX and 4.4 months (range 0.21 – 18.9) for patients receiving everolimus.

A statistically significant improvement in PFS was demonstrated for CABOMETYX compared to everolimus (Figure 1 and Table 4). A planned interim analysis of OS was conducted at the time of the PFS analysis and did not reach the interim boundary for statistical significance (HR=0.68 [0.51, 0.90], p=0.006). In a subsequent unplanned interim analysis of OS, a statistically significant improvement was demonstrated for patients randomised to CABOMETYX as compared with everolimus (median of 21.4 months vs. 16.5 months; HR=0.66 [0.53, 0.83], p=0.0003; Figure 2 and Table 5).

Exploratory analyses of PFS and OS in the ITT population have also shown consistent results in favour of CABOMETYX compared to everolimus across different subgroups according to age (<65 vs. ≥65, sex, MSKCC risk group (favourable, intermediate, poor), ECOG status (0 vs. 1), time from diagnosis to randomisation (<1 year vs. ≥1 year), tumour MET status (high vs. low vs. unknown), bone metastases (absence vs. presence), visceral metastases (absence vs. presence), visceral and bone metastases (absence vs. presence), number of prior VEGFR-TKIs (1 vs. ≥2), duration of first VEGFR-TKI (≤6 months vs. >6 months).

Objective response rate findings are summarised in Table 6.

**Figure 1: Kaplan Meier curve for PFS by independent radiology review committee (Primary PFS analysis population - first 375 randomised)**

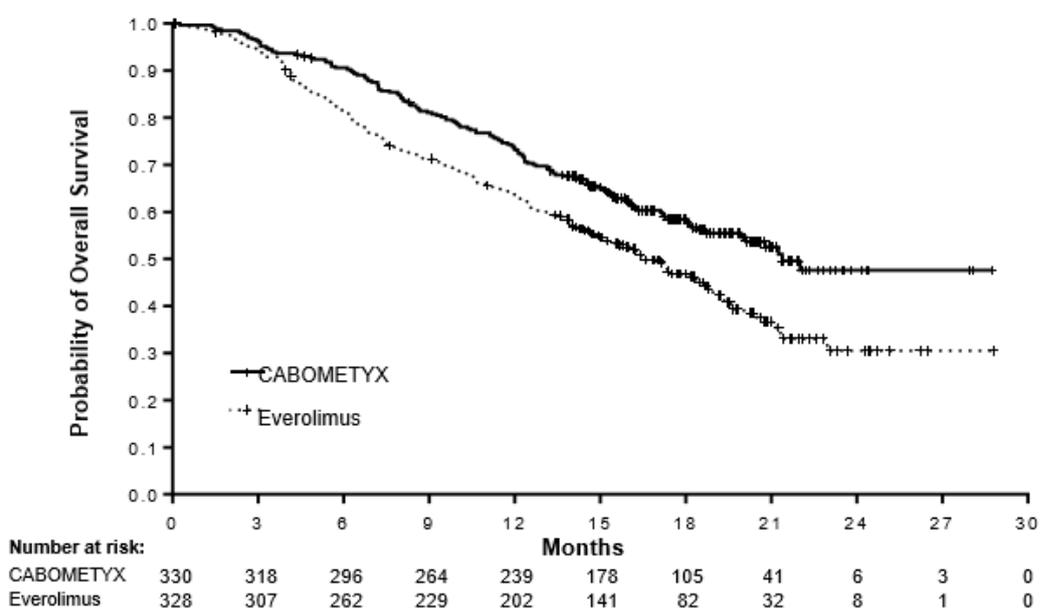

**Table 4: Summary of PFS findings by independent radiology review committee**

Endpoint	Primary PFS analysis Population		Intent-To-Treat Population	
	CABOMETYX	Everolimus	CABOMETYX	Everolimus
	N = 187	N = 188	N = 330	N = 328
Median PFS (95%CI), months	7.4 (5.6, 9.1)	3.8 (3.7, 5.4)	7.4 (6.6, 9.1)	3.9 (3.7, 5.1)

## 5.2 PHARMACOKINETIC PROPERTIES

### Absorption

Following oral administration of cabozantinib, peak cabozantinib plasma concentrations are reached at 2 to 3 hours post-dose. Plasma-concentration time profiles show a second absorption peak approximately 24 hours after administration, which suggests that cabozantinib may undergo enterohepatic recirculation.

Repeat daily dosing of cabozantinib at 140 mg for 19 days resulted in an approximately a 4- to 5-fold mean cabozantinib accumulation (based on AUC) compared to a single dose administration; steady state is achieved by approximately Day 15.

A high-fat meal moderately increased  $C_{max}$  and AUC values (41% and 57%, respectively) relative to fasted conditions in healthy volunteers administered a single 140 mg oral cabozantinib dose. There is no information on the precise food-effect when taken 1 hour after administration of cabozantinib.

Bioequivalence could not be demonstrated between the cabozantinib capsule and tablet formulations following a single 140 mg dose in healthy subjects. A 19% increase in the  $C_{max}$  of the tablet formulation (CABOMETYX) compared to the capsule formulation

(COMETRIQ) was observed. A less than 10% difference in the AUC was observed between cabozantinib tablet (CABOMETYX) and capsule (COMETRIQ) formulations.

### **Distribution**

Cabozantinib is highly protein bound in vitro in human plasma ( $\geq 99.7\%$ ). Based on the population pharmacokinetic (PK) model, the volume of distribution ( $V_z$ ) is approximately 319 L (SE:  $\pm 2.7\%$ ). Protein binding was not altered in subjects with mild or moderately impaired renal or hepatic function.

### **Metabolism**

Cabozantinib was metabolised in vivo. Four metabolites were present in plasma at exposures (AUC) greater than 10% of parent: cabozantinib-N-oxide, cabozantinib amide cleavage product, cabozantinib monohydroxy sulfate, and 6-desmethyl amide cleavage product sulfate. Two non-conjugated metabolites (cabozantinib -N-oxide and cabozantinib amide cleavage product), which possess  $<1\%$  of the on-target kinase inhibition potency of parent cabozantinib, each represent  $<10\%$  of total drug-related plasma exposure.

Cabozantinib is a substrate for CYP3A4 metabolism in vitro.

### **Excretion**

In a population PK analysis of cabozantinib using data collected from 318 patients with RCC and 63 normal healthy volunteers following oral administration of doses of 60 mg, 40 mg, and 20 mg, the plasma terminal half-life of cabozantinib is approximately 99 hours. Mean clearance (CL/F) at steady-state was estimated to be 2.2 L/hr. Within a 48-day collection period after a single dose of  $^{14}\text{C}$ -cabozantinib in healthy volunteers, approximately 81% of the total administered radioactivity was recovered with 54% in faeces and 27% in urine.

### **Pharmacokinetics in special patient populations**

#### Renal impairment

Results from a study in patients with renal impairment indicate that the ratios of geometric LS mean for plasma cabozantinib,  $C_{\max}$  and  $\text{AUC}_{0-\text{inf}}$  were 19% and 30% higher, for subjects with mild renal impairment (90% CI for  $C_{\max}$  91.60% to 155.51%;  $\text{AUC}_{0-\text{inf}}$  98.79% to 171.26%) and 2% and 6-7% higher (90% CI for  $C_{\max}$  78.64% to 133.52%;  $\text{AUC}_{0-\text{inf}}$  79.61% to 140.11%), for subjects with moderate renal impairment compared to subjects with normal renal function. Patients with severe renal impairment have not been studied.

#### Hepatic impairment

Results from a study in patients with hepatic impairment indicate that exposure ( $\text{AUC}_{0-\text{inf}}$ ) increased by 81% and 63% in subjects with mild and moderate hepatic impairment, respectively (90% CI for  $\text{AUC}_{0-\text{inf}}$ : 121.44% to 270.34% for mild and 107.37% to 246.67% for moderate). Patients with severe hepatic impairment have not been studied.

### Race

A population PK analysis did not identify clinically relevant differences in PK of cabozantinib based on race.

## **5.3 PRECLINICAL SAFETY DATA**

### **Genotoxicity**

Cabozantinib has shown no mutagenic or clastogenic potential in a standard battery of genotoxicity assays (bacterial reverse mutation assay, chromosomal aberration assay using human lymphocytes and a mouse micronucleus test).

### **Carcinogenicity**

The carcinogenic potential of cabozantinib has been evaluated in two species: rasH2 transgenic mice and Sprague-Dawley rats. Cabozantinib was not carcinogenic in the 26-week carcinogenicity study in rasH2 transgenic mice at doses  $\leq 15$  mg/kg/day, resulting in exposures approximately 4 times the human AUC at the recommended clinical dose of 60 mg/day. In the 2-year rat carcinogenicity study, cabozantinib-related neoplastic findings consisted of an increased incidence of benign pheochromocytoma, alone or in combination with malignant pheochromocytoma of the adrenal medulla in both sexes at doses  $\geq 0.1$  mg/kg/day, resulting in exposures well below the intended exposure in humans. The clinical relevance of the observed neoplastic lesions in rats is uncertain, but likely to be low.

Cabozantinib was not carcinogenic in the rasH2 mouse model at a slightly higher exposure than the intended human therapeutic exposure.

## **6 PHARMACEUTICAL PARTICULARS**

### **6.1 LIST OF EXCIPIENTS**

#### Tablet content

Microcrystalline cellulose,  
Lactose,  
Hyprolose,  
Croscarmellose sodium,  
Colloidal anhydrous silica  
Magnesium stearate

#### Film-coating

Hypromellose,  
Titanium dioxide,  
Triacetin  
Iron oxide yellow.

### **6.2 INCOMPATIBILITIES**

Not applicable

### 6.3 SHELF LIFE

In Australia, information on the shelf life can be found on the public summary of the Australian Register of Therapeutic Goods (ARTG). The expiry date can be found on the packaging.

### 6.4 SPECIAL PRECAUTIONS FOR STORAGE

Store below 25°C

### 6.5 NATURE AND CONTENTS OF CONTAINER

CABOMETYX 20 mg film-coated tablets are available as a pack size of 30 film-coated tablets in a HDPE bottle with a polypropylene child-resistant closure and three silica gel desiccant canisters.

CABOMETYX 40 mg film-coated tablets are available as a pack size of 30 film-coated tablets in a HDPE bottle with a polypropylene child-resistant closure and three silica gel desiccant canisters.

CABOMETYX 60 mg film-coated tablets are available as a pack size of 30 film-coated tablets in a HDPE bottle with a polypropylene child-resistant closure and three silica gel desiccant canisters.

### 6.6 SPECIAL PRECAUTIONS FOR DISPOSAL

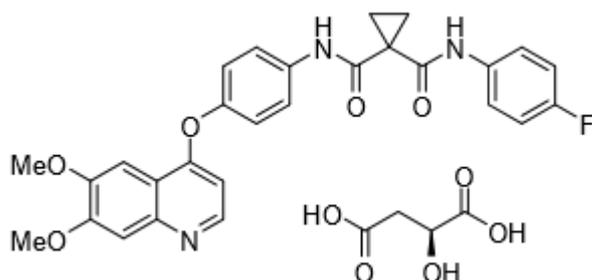

In Australia, any unused medicine or waste material should be disposed of by taking to your local pharmacy.

### 6.7 PHYSICOCHEMICAL PROPERTIES

#### Chemical structure

CABOMETYX contains the (S)-malate salt of cabozantinib, a kinase inhibitor. Cabozantinib (S)-malate is described chemically as N-(4-(6,7-dimethoxyquinolin-4-yloxy)phenyl)-N'-(4-fluorophenyl)cyclopropane-1,1-dicarboxamide, (2S)-hydroxybutanedioate.

The molecular formula is  $C_{28}H_{24}FN_3O_5 \cdot C_4H_6O_5$  and the molecular weight is 635.6 Daltons as malate salt.
